Division: A2

Subject : Programming with java

Assignment 4: Develop a Java application demonstrating the use of wrapper classes for conversion between primitive data types and objects, and performing basic operations on wrapped values..

Program:

```
public class WrapperDemo {  
    public static void main(String[] args) {  
        int a = 10;  
        Integer obj = a;  
        int b = obj;  
        int sum = obj + 20;  
        System.out.println("Primitive: " + a);  
        System.out.println("Wrapper: " + obj);  
        System.out.println("Unboxed: " + b);  
        System.out.println("Sum: " + sum);  
    }  
}
```

Question 1: 1.Create a program to convert student marks from String format to Integer and calculate total marks.

```
public class StudentMarks {  
    public static void main(String[] args) {  
  
        String m1 = "80";  
        String m2 = "90";
```

```

        int marks1 = Integer.parseInt(m1);
        int marks2 = Integer.parseInt(m2);
        int total = marks1 + marks2;
        System.out.println("Total Marks = " + total);
    }
}

```

Question 2: Develop an Employee Payroll System that accepts employee IDs, basic salary, and bonus amounts from the user. Convert the entered values into wrapper objects and perform validation operations to ensure valid salary values before calculating the net salary.

```

import java.util.Scanner;

public class Payroll {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        System.out.print("Employee ID: ");
        Integer id = sc.nextInt();
        System.out.print("Basic Salary: ");
        Double salary = sc.nextDouble();
        System.out.print("Bonus: ");
        Double bonus = sc.nextDouble();
        if (salary > 0 && bonus >= 0) {
            Double netSalary = salary + bonus;
            System.out.println("Net Salary = " + netSalary);
        } else {
            System.out.println("Invalid Salary!");
        }
        sc.close();
    }
}

```
